Decision Tree : Decision tree is the most powerful and popular tool for classification and prediction. A Decision tree is a flowchart like tree structure, where each internal node denotes a test on an attribute, each branch represents an outcome of the test, and each leaf node (terminal node) holds a class label.

Gini index

$$\text{Gini Index} = 1 - \sum_j P_j^2$$

- Gini Index is a metric to measure how often a randomly chosen element would be incorrectly identified.
- It means an attribute with lower gini index should be preferred.
- Sklearn supports “gini” criteria for Gini Index and by default, it takes “gini” value.

Entropy

if a random variable x can take N different value ,the i^{th} value x_i with probability $p(x_{ii})$,we can assocoate the folloeing entropy with x:

$$H(x) = -\sum_{i=1}^{N} p(x_i) \log_2 p(x_i)$$

- Entropy is the measure of uncertainty of a random variable, it characterizes the impurity of an arbitrary collection of examples. The higher the entropy the more the information content.

Information Gain

Definition: Suppose S is a set of instances, A is an attribute, S_v is the subset of s with A = v and Values(A) is the set of all possible of A,then

$$\text{Gain}(S,A) = \text{Entropy}(S) - \sum_{v\ :va(A)} \frac{|S_v|}{|S|} \text{Entropy}(S_v)$$

$|S|$ denotes the size of set S

- The entropy typically changes when we use a node in a decision tree to partition the training instances into smaller subsets. Information gain is a measure of this change in entropy.
- Sklearn supports “entropy” criteria for Information Gain and if we want to use Information Gain method in sklearn then we have to mention it explicitly.

Accuracy score

- Accuracy score is used to calculate the accuracy of the trained classifier.

Confusion Matrix

- Confusion Matrix is used to understand the trained classifier behavior over the test dataset or validate dataset.
